ctrl	alt Ⓢ	Ⓢ	spacebar /option+spacebar = turn RTL (MAC OS X 10.2.x only)											

The basic characters (defined in Unicode 3–4) are the same in fonts Alphetum and Code 2001. The variants included in the Private Use Area are different in each font. Please read Juan José Marcos' documentation included to this package.

Explanations:

(...) Additional info or explanation

[...] Absent in Etruscan, later developed in various Old Italic idioms

In each cell, corresponding to a key, the characters in the upper side show what you see on the physical keyboard, whereas the **bold characters** in the lower side are the usual or conventional transcription in Latin characters. The basic Etruscan and Old Italic letters are located on their approximate equivalents for the U.S. qwerty keyboard, with a conventional location for *f*, *s/ś/š*, *th*, *kh/ch* and *uu/ú*. One *s*, most similar to Latin, is located on the S key, the other variants on the keys W (i.e. above S), X (below S) and , (next to M, to which it is similar in shape).

### How to read the keylayout

Example with letter e, which uses all the levels. In other cases (e.g. on key 1, only one level is used; on key 5, the levels shift and option+shift are not used; some keys are unused, at least in this version).

<p>Level 2 = Capslock+key = Standard LTR character</p> <p>Level 1 = Shift+key, first variant</p> <p>Level 0 = key = Standard RTL character</p>	<p>e</p> <p>Ǝ Ǝ</p> <p>Ǝ Ǝ</p> <p>Ǝ Ǝ</p> <p>e</p>	<p>Level 5 = Option + Capslock + key; variant</p> <p>Level 4 = Option + Shift + key; variant</p> <p>Level 3 = Option+shift+key; variant</p>
